

Tens, then ones

- 1 **Partition** the second number into tens and ones.
- 2 Count on the **tens** from the first number.
- 3 Will the ones go past the next ten? If not, add them.
- 4 If they will, add enough ones to **reach the next ten**.
- 5 Add the ones that are left.

Worked example: $48 + 25$: $48 + 20 = 68$, $68 + 2 = 70$, $70 + 3 = 73$
